Outline

The Maxell's LR battery is a compact, light and economical alkaline battery having a nominal voltage of 1.5V. The LR battery is less expensive than silver oxide batteries and usable with a wide variety of equipment, ranging from electronic calculators to electric toys. Based on many years of experience and know-how in the field of silver oxide batteries, the LR battery boasts high quality and high reliability.

Cross-sectional diagram

Positive electrode (manganese dioxide)

■Principle and reaction

The button-type alkaline battery uses manganese dioxide (MnO_2) as its positive active material and zinc (Zn) as its negative active material. Potassium hydroxide (KOH) is used as an electrolyte.

Battery Reactions

Positive reaction: MnO₂ + H⁺ + e⁻ → MnOOH

Negative reaction: Zn + 20H → Zn0 + H₂0 + 2e⁻

Total reaction: 2MnO₂ + H₂O + Zn → 2MnOOH + ZnO

■Features

- Excellent cost-performance
 - Unlike silver oxide batteries that use the precious metal, silver, the alkaline battery features good cost-performance because it uses low-cost manganese dioxide as its active material.

- Superior leakage* resistance
 Like silver exide batteries, the
 - Like silver oxide batteries, the LR battery is manufactured using the Maxell's original leak-resistant processing that suppresses the electrolyte from rising up and seeping out a basic phenomenon of alkaline electrolytes.
- · Excellent heavy load characteristics
 - The LR battery offers excellent heavy load characteristics and employs a separator featuring low internal resistance, good liquid holding properties and high-drain characteristics.
 - (* Leakage is defined as an unintended escape of liquid from a battery.)

■Applications

Mini-game machines, electronic calculators, electronic clocks, electronic watches, measuring instruments, electronic lighters, electronic thermometers, cameras, compact radios, and various types of remote controllers, etc.
